

Completion of Starvation Dam Important

FROM THE TOP of the Starvation Dam, 155 feet above the floor of the valley, the temporary reservoir can be seen. It was created so last minute work could be finished on the outlet works, which were closed Monday. At the same time, the temporary dam was breached, letting the first water begin to back up behind the mammoth structure.

THE CATERPILLAR operator backs off after cutting through a temporary dam, letting water boil down the face of it before equalizing and pressing against the 750-foot-thick base of the Starvation Dam. In order to take this picture, the photographer stood on ground which no one else will walk on for a long long time.
